

# Hello.

This is an example of using groff to some effect on Windows.

- It isn't ideal.
  - It's good enough to get some actual work done.
- With the aid of some shell scripts, the updating of the PDF mostly just works.
  - There's a shell script running in the top left window, polling test.tr every second via `$( ls -l )`
  - If the output of `$( ls -l )` differs, a shell script is run that runs groff, then ghostscript
  - mupdf may then be updated by clicking on its window, then pressing 'r'
    - On unix, mupdf may be send SIGHUP in order to update the current file
    - Windows is not unix.
  - The PDF output is good.
    - `$ du test.pdf`  
79 test.pdf
